

Integrate

eReady - Energize your Fuel Terminals

eReady allows the integration of charging stations into your filling station infrastructure and makes your entry into e-mobility a piece of cake. With the activation, you enable your fuel terminal to process the payment and authorization of fuel pumps and charging columns at the same time.

In simple terms, eReady transforms electricity into a further fuel you can offer at your filling station in the future. The authorization process will be reliably processed at the charging stations via the Open Point Charge Protocol.

As a provider of holistic solutions, we count on a consistent system and the simple extension of the existing infrastructure. In this way, we allow for the operation of fuel pumps and charging stations in mixed operation - with very low investment!

Ihre Vorteile

- ✓ **Entry into e-mobility with very low investment**
- ✓ **Easy extension of filling station infrastructure**
- ✓ **Fuel terminals HecVision Eco, HecStar, HecFleet und Heconomy control the authorization of fuel pumps and charging columns**
- ✓ **Communication via Open Charge Point Protocol (OCPP 1.6)**
- ✓ **Comprehensive after-sales service: Support hotline, employee training and repair centre**

Functional Principle

1. The vehicle stops at the fuel pump or charging station.
2. An instruction leads to the fuel terminal.
3. The authorization of the refuelling or charging process is performed at the fuel terminal.
4. After authorizing, the charging column and type of charge is selected at the fuel terminal.
5. The vehicle is connected to the charging station at the charging point, and the charging process is started.
6. When the desired charging level is reached, the charging process at the fuel terminal is stopped and a receipt is issued.
7. Now the connection between the vehicle and the charging station can be interrupted at the charging point.
8. The vehicle continues its journey.
